Protection of Existing Septic Systems During Pavement Reclamation

1. Review this protection plan with the contractor prior to the start of construction.
2. Spray paint the location of the laterals, septic tanks, distribution boxes, and leaching fields.
3. Dig by hand to locate the top of the septic systems so that in the following step where the pavement is removed the septic systems will not be damaged.
4. During pavement reclamation, the reclamation machine shall not be used on top of the septic systems. The pavement in these areas is to be carefully peeled up and removed with an excavator without damaging any components of the systems.
5. When grading and compacting the subbase above the septic systems, a plate compactor is to be used to prevent damage to the septic systems.
