

Fishing on Ball Pond

By George Buck

Ball Pond is predominantly a bass and trout lake. It is stocked each spring by the Department of Energy and Environmental Protection's (DEEP) Inland Fisheries Unit with 2,730 legal-sized trout consisting mostly of browns and rainbows. The thermocline, a narrow band of cool, oxygenated water, persists through late summer which allows many trout to holdover and become larger with the maximum size averaging a few pounds or more.

The bass fishing is exceptional. The DEEP's Inland Fisheries Unit has rated Ball Pond the Second Best Bass Lake in Connecticut based upon the quantity of fish and the quality of their size as determined by electro-shocking surveys which are conducted every three years. Fishing pressure is moderate, primarily because Ball Pond is a "paddle-power" lake with a "no motors of any kind" restriction. Fishermen also practice "catch and release" to a much greater extent on Ball Pond than other similar bodies of water due to its exceptional quality.

Other species such as panfish can be marginal. There is a good bullhead and bluegill population, but limited white and yellow perch. There are few calico bass or pickerel.

Grass carp were established in 1997 for weed control. This on-going project with the DEEP has been quantified through annual weed surveys as an exceptional success, reducing the weed biomass to about 50% of the pre-stocking volume. This project continues. Grass carp are a protected species with no allowed fishery for them.
